**Valid from** 25.09.2015

**Updated** 20.04.2020

#### Technical instructions

MyVallox ventilation units can be controlled with Modbus RTU-compatible building automation systems. Up to 32 MyVallox ventilation units can be connected in the same Modbus line. Through a building automation system it is possible to control the ventilation unit, it e.g. read different sensor values and change the status of the ventilation unit.

#### **GENERAL INFORMATION**

Everything that can be changed from user interfaces can also be changed over Modbus RTU.

MV control does not have Modbus TCP option.

Data format is always 16 bit unsigned word.

All the registers are of type "holding register".

#### **Supported function codes:**

- · Read holding registers, 0x03
- Write single register, 0x06
- Write multiple registers, 0x10

Writing to undefined registers is forbidden and will return error code. This needs to be considered when writing multiple registers at once.

- Writing to registers 20504 20508 does NOT work. Register 20504 is undefined.
- Writing to registers 20505 20508 works. Registers are defined and writable.

Writing to read-only registers (R) is forbidden and will return error code.

Writing values outside given min - max range is forbidden and will return error code.

#### CHANGING BETWEEN PROFILES

MV -control has two basic profiles: Home profile and away profile. One of these is always selected.

 Basic profile can be read and set from register 4609, 0=home profile and 1=away profile.

MV-control also has three timed profiles: Boost profile, fireplace profile and programmable profile. Timed profiles override the chosen basic profile temporarily. Wanted profile is activated by writing the wanted running time in minutes to the profile's timer register. The profile activates and the timer register starts counting down. When all timer registers of all timed profiles are zero, the MV-control changes back to the chosen basic profile.

- · 4612=boost profile timer register
- 4613=fireplace profile timer register
- 4614=programmable profile timer register

Timed profile can be set to run indefinitely by writing value 65535 to the profile's timer register. This disables the countdown of the timer until the timer register is reset manually or profile is changed from some other user interface.

Timers can also be deactivated from corresponding timer switch registers, 0=timer off and 1=timer on. This will also disable timers for all user interfaces. NOTE: Using MV digital input for changing profiles also changes the contents of the timer switch registers.

- 21766=boost profile timer enabled -register
- 21767=fireplace profile timer enabled -register
- 21772=programmable profile timer enabled –register

# **Example: Activating fireplace profile for 15** minutes

- Write 15 to register 4613.
- · Write 1 to register 21767 (If not already written).

# Example: Activating boost profile without timer (profile stays on)

- Method 1:
- Write 65535 to register 4612.
- Method 2:
- · Write any value (non-zero) to register 4612.
- Write 0 to register 21766.

# Example: Turning off boost profile, return to chosen basic (away/home) profile

- Write 0 to 4612.
- Optionally write 0 to registers 4613, 4614 to turn off all timed profiles.

# Example: Switch from home profile to away profile

- Write 1 to 4609.
- Optionally write 0 to registers 4612, 4613, 4614 to turn off all timed profiles.

### PROFILE PRIORITY

If more than one profiles are active at the same time, the higher-priority profile overrides any other profile. For example, if the Fireplace profile and the Boost profile are simultaneously active, the ventilation unit uses the Fireplace profile. The profile priority order is:

- 1. Programmable profile
- 2. Fireplace profile
- 3. Boost profile
- 4. Home/Away (basic) profile

#### SWITCHING UNIT OFF

Unit can be switched off by writing 5 to register 4610, and switched on by writing 0 to register 4610.

#### **UNIT FAULT CONDITION**

Unit fault condition can be read from register 4621. 0 = normal operation, 1 = fault. Type of fault can be only read from MV user interface.

### **DATA CONVERSION FORMULAS**

Temperatures are given in centKelvins.

- Celsius temperature = (centKelvin 27315) / 100
- centKelvin = (Celsius temperature \* 100) + 27315

Register contents in general are given in the register description, inside square brackets, in numerical order starting from zero.

- [no sensor, low, med, high]:
- 0 = no sensor
- 1 = low
- 2 = med
- 3 = high

#### **MODBUS SETTINGS**

If the ventilation unit is connected to e.g. a building automation system through Modbus line, the following Modbus settings must be given:

- · Ventilation unit Modbus address
- · Modbus baud rate
- Modbus parity
- · Modbus stop-bit

This document describes how to make those settings using either the MyVallox Control control panel or the Web interface. With these instructions you can also set individual settings, such as the Modbus address.

#### MODBUS SETTINGS USING MYVALLOX CONTROL -CONTROL PANEL

To set the Modbus settings, proceed as follows:

1 Select Settings

2 Use the arrow buttons and select Expert settings:

3 Press the OK button:

4 Use the arrow buttons and select Modbus settings:

5 Press the OK button:

6 The Modbus 1/4 screen opens.

- 7 Set the Modbus address of the ventilation unit by using the Plus and Minus buttons. You can choose the address within the range 1 ... 247.
- 8 Press the Right arrow button.
- 9 The Modbus 2/4 screen opens.

- 10 Set the Modbus Baud rate by using the Plus and Minus buttons. The options are 9600, 19200, 38400, 57600 or 115200.
- 11 Press the Right arrow button.
- 12 The Modbus 3/4 screen opens.

- 13 Set the Modbus Parity by using the Plus and Minus buttons. The options are:
  - no No parity
  - even Even parity
  - odd Odd parity
- 14 Press the Right arrow button.
- 15 The Modbus 4/4 screen opens.

- 16 Set the Modbus Stop bit by using the Plus and Minus buttons. The options are 1 or 2.
- 17 Press the OK button:

18 The Modbus settings are now complete.

#### MODBUS SETTINGS USING THE WEB INTERFACE

You can also set the Modbus settings for the MyVallox ventilation unit through the Web interface. There are two options:

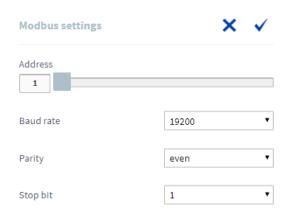

- MyVallox Home local network connection
- MyVallox Cloud cloud service
- 1 Select Expert settings.
- 2 Scroll the screen until you see the Modbus settings.

3 Press the Edit button:

4 The Modbus settings screen opens in the edit mode:

- 5 Set the Modbus address of the ventilation unit in the Address field. You can set the address by sliding the blue slider. You can choose the address within the range 1 ... 247.
- 6 Select the Modbus connection speed in the Baud rate drop down menu. The options are 9600, 19200, 38400, 57600 or 115200.
- 7 Select the Modbus parity in the Parity drop down menu. The options are:
  - no No parity
  - even Even parity
  - odd Odd parity
- 8 Set the Modbus stop bit in the Stop bit field. The options are 1 or 2.
- 9 Press the OK button.

10 The Modbus settings are now complete.

### **MODBUS OBJECTS**

FANS_SPEED   R	addr	Variable name	R/RW	min	max	Туре	Description
